Complete Listing of Claims

This listing of claims will replace all prior versions and listings of claims in the application. Please amend the claims as follows:

- 1. (Previously presented) A method of forming a composite material comprising: combining carbon-containing fibers, a carbonizable matrix material which includes a thermoplastic pitch, and a friction additive to form a mixture; heating the mixture to a sufficient temperature to melt at least a portion of the matrix material, the step of heating including: applying an electric current to the mixture to generate heat within the mixture; and while heating the mixture, applying a pressure of at least 35 kg/cm² to the mixture to form a compressed composite material.
- (Original) The method of claim 1 wherein said additive comprises at least one of carbides, oxides, isotropic coke, and combinations thereof.
- (Original) The method according to claim 1 wherein said additive comprises
 at least one of an oxide or carbide of silicon, boron, titanium, molybdenum,
 vanadium, chromium, hafnium, zirconium, tungsten, and combinations
 thereof.
- (Original) The method according to claim 1 wherein said additive comprises
 particles of at least one of SiC, SiO₂, and combinations thereof.

- 5. (Original) The method according to claim 2 wherein said additive comprises said oxide and further comprising heat treating said compressed composite material to sufficient temperature for a sufficient period of time to convert said oxide to a carbide.
- (Original) The method according to claim 5 further comprising impregnating said compressed composite material with a carbonizable material.
- 7. (Original) The method of claim 1, wherein the step of heating and applying pressure comprises heating the mixture to a temperature of at least 500 °C to form a compressed composite material having a density of at least about 1.3 g/cm³ within thirty minutes.
- (Original) The method of claim 1, wherein the carbon-containing fibers include at least one of mesophase pitch based carbon fibers, polyacrylonitrile carbon fibers, and combinations thereof.
- (Original) The method of claim 1, wherein the matrix material comprises finely divided pitch.
- 10. (Original) The method of claim 1, wherein the step of heating comprises: heating the mixture for a first period of time at a first temperature by applying a first power level; and

heating the mixture for a second period of time at a second temperature higher than the first temperature by applying a second power level higher than the first power level.

- 11. (Original) The method of claim 1, wherein the step of combining comprises combining about 20-77% by weight of said carbon-containing fibers with about 50-20% by weight of said carbonizable matrix material and about 3-30% by weight of said additive.
- 12. (Original) The method of claim 1, further comprising: increasing the density of the compressed composite by introducing a carbonizable material into voids in the compressed composite and then baking the compressed composite to achieve a density of at least about 1.6 g/cm³.

13-18 (canceled)

- 19. (Previously presented) A method of forming a composite material suitable for vehicle brakes comprising the steps of:
 - a) compressing a mixture of carbon fibers, a matrix material which includes a thermoplastic pitch, and a friction additive, wherein said additive comprises at least one of a carbide, an oxide, isotropic coke, and combinations thereof;

- b) during the step of compressing, applying a current to the mixture, the mixture providing a sufficient electrical resistance to the current such that the mixture reaches a temperature of at least 500 °C to form a compressed preform;
- introducing a carbonizable material into the compressed preform to form an impregnated preform;
- d) optionally, baking the product of step c) to carbonize the carbonizable material;
- e) optionally repeating step c) and step d); and
- f) graphitizing the impregnated preform to a final temperature of at least about 1500 °C to form the composite material, the graphitized preform having a density of at least about 1.7 g/cm³ if step c) is repeated no more than once.

20. (Canceled)
